

CORROSION, WHEN DOES IT START?

Even on brand new vessels, surface maintenance needs to be carried out. **Corrosion begins within the first 6 months** of a new build vessels delivery and with many vessels not seeing the need to carry surface preparation tooling straight away, the problem gets overlooked.

Having tools onboard means the crew can proactively cure the vessel of corrosion before any major work is required. This saves money and time in the long run. We supply fleet owners with new build surface preparation packages tailored to the specific vessel needs, minimising costs and falling inline with vessel budgets.

NEW BUILD VESSEL PACKAGE

Trelawny have prepared a specialist "New Build Vessel" package with the specific focus on products designed for small area maintenance. This package allows for maximum flexibility when maintaining brand new vessels.

These simple to use, low maintenance tools can be deployed to any area of the vessel with minimal safety and application training.

Use the versatile Trelawny hand tools for multiple applications which are perfect for hard to access areas, tanks and overhead work. Air consumption is very low with requirements as low as 4 / 10 CFM. The long life tools and consumables give high productivity in most environments with minimal maintenance.
